

Amendments to the Specification:

Please amend the paragraph on page 7, beginning at line 19 as follows:

For a DVD player, media processing system 31 preferably receives compressed digital data from a DVD or CD, and decompresses the data. At the same time, media processing system 31 may receive digital data stored on a ROM, for example ROM [[40]] 37, or input from another digital data source, and generate a video game environment in which the decompressed DVD or CD color images are displayed along with the data received from the ROM or other digital data source. Thus, an interactive, full-motion, color multimedia game may be operated by media processing system 31.

Please amend the paragraph on page 12, beginning at line 4 as follows:

FIG. 8 shows an isolated view of the vista point setting area 415 for entering all of the important vista point information. As vista points are added in setting area 415, the initial values will be set to the defaults shown, however the default values may be modified. Vista point setting area 415 edits a previously created vista point selected from vista point chart 410. Name field 800 is one the only pieces of data that doesn't get used by a NUON.TM. system or displayed on any menu screen. Name field 800 is for the benefit of the author. Text entered in name field 800 is displayed in the name column 700 of the vista point chart 410. Each vista point of a z-frame [[has]] will have its own name.
